Reflective Glass

Reflective Glass is high-performance architectural glass coated with a thin metallic or metal oxide layer that reflects a portion of solar radiation and visible light. This specialized coating helps reduce solar heat gain, minimize glare, and improve energy efficiency while giving buildings a sleek, contemporary appearance. Reflective glass is widely used in commercial, institutional, and high-rise developments where aesthetics and performance are equally important.

Reflective glass is an ideal solution for projects that require solar control, energy efficiency, and contemporary aesthetics. By combining thermal performance with a distinctive reflective finish, it helps create comfortable, sustainable, and visually striking buildings for modern architecture.
